

NUSIA FREE TRIAL CLASSES: NOVICE

WORKSHEET DAY 1

ALPHABETH

There are 5 vowels and 21 consonants in the Indonesian alphabet. As well as representing individual sounds, they also combine to form other phonemes, namely *ng* [ŋ], *ny* [ɲ], *sy* [ʃ] and *kh* [x].

In addition, some of the vowels have more than one variation of sound, or allophones as they are known. For instance, the vowel *e* can be pronounced as [æ, e and ə]. Indonesian also has three diphthongs: *ai* [aj], *oi* [oj] and *au* [aj].

The remainder of this section comprises a detailed explanation of how to pronounce the various sounds in the Indonesian language. Some examples are also listed alongside the explanations in order to aid your understanding of the different phonemes.

Vowels

1. *a* is pronounced [a], like *a* in *car*.

anda
bawa

[an.da]
[ba.wa]
